

What is NaviScribe?

NaviScribe is a new digital pen technology, with unparalleled accuracy and flexibility, sporting superior hover, and pure motion resolution. Its novel design is lightweight and requires no special display screens (or indeed screen at all), making it suitable for use with a wide variety of devices, from smart whiteboards to tablet PCs to cell phones.

NaviScribe devices also capture their full spatial motion as they travel across or above a writing surface. This absolute 3-D motion data, rich in information not available from methods that capture only relative motion, can be applied to handwriting recognition, biometric authentication, and command/input differentiation in a tablet user interface.

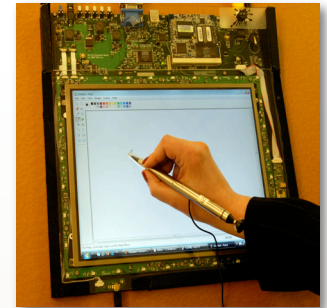

Our group at Electronic Scripting Products have put over five years of R&D into the development of the underlying optical navigation tech-

nology to enable rapid and accurate 3-dimensional motion capture and extraction of digital ink and gestures. We believe that this alternative digitization technology can vastly simplify the digital interface and raise the bar on functionality and value requirements. The advantages of NaviScribe do not end with the inherent elegance of the solution. In contrast with presently available technologies, which typically have a difficult time pairing touch technology with stylus input, NaviScribe is

compatible with any touch technology. We also support a multitude of pen designs (ranging from plastic to metal) without compromising high hover, superior absolute and relative motion resolution and screen viewing quality.

Naviscribe is an optical pen digitizing technology that does not interfere with touch technologies. It can operate with any screen (size and aspect ratio), supports virtually unlimited pen customization, and eliminates the need for expensive warehousing of fully integrated display and digitizer units.

Since this optical technology does not require a layer in the screen stack, you will be able to make your tablet PCs or other devices lighter, thinner and much easier to manufacture.

To learn more about the NaviScribe technology, please visit us at www.naviscribe.com. On the first page you will find a short movie explaining how it works. We hope that you will find our solution compelling.
